

Case study: Safer Buildings Taskforce Portal

The Opportunity

The Safer Buildings Taskforce was established to help identify buildings in Queensland that may have combustible cladding.

The Department of Housing and Public Works required the development of a portal to allow owners of buildings in Queensland to register their building, complete a number of forms to help identify potentially combustible cladding and lodge associated documentation.

4impact's Approach

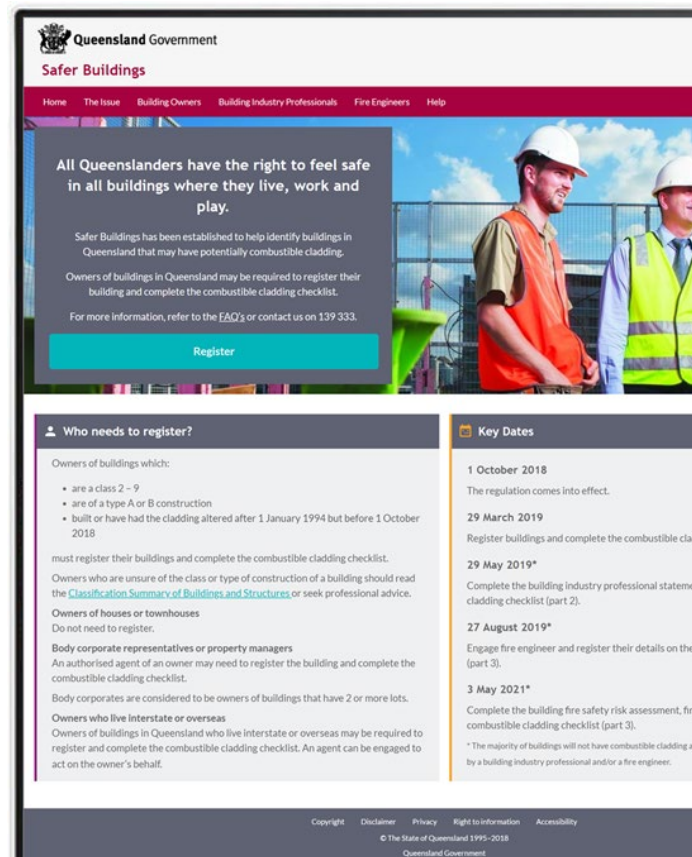

4impact assembled a comprehensive development team to deliver a fully operational Sitecore website and submissions portal; hosted within Microsoft Azure cloud.

The 4impact team used an Agile delivery approach to address the tight timelines and dynamically changing requirements due to legislative changes.

Provisioning of the site via DevOps, fortnightly sprint planning and showcases, automated testing and a transparent approach to working with diverse stakeholders were essential for a successful outcome.

Project Outcome

The site featured the use of customised forms, secure cloud storage and an *in-confidence* security classification. The solution topology was fully aligned to the Queensland Government policies on architecture and security using government CUE templates and style guides throughout.
